

e-UPENDER

The roll upender is characterized by a compact footprint and limited space requirements. A special design has been developed with the needs of customers in mind, particularly those dealing with space constraints. e-UPENDER is an innovative solution that significantly reduces energy consumption, maintenance operations, and noise levels.

The space-saving concept has been achieved by upending the reel on itself, using a highly efficient engineered system.

Movement is fully electric, making it possible to completely eliminate the traditional hydraulic system and its related installation and maintenance issues, such as pipes, oil, filters, hydraulic pumps, and so on.

We have also **enhanced the safety factor** by managing all movements through PLC and motor control.

The motor, driven by an inverter, allows the speed to be adjusted from the operator panel according to production needs: with small reels, the speed can be increased, while for heavier production runs it can be reduced.
